

MacroBrief

Brandbook — the mark, its construction, and the rules that keep it a Macro brand.

The mark

MacroBrief inherits the family's isometric **M** on the family canvas 0 0 1000 698.86, and seats its object in the M's notch on the same band the sibling marks put their rhombus tiles on — but, unlike them, it draws the object **behind** the M.

What sits in the notch is what differs, and it is the only part that carries meaning.

BRAND	IN THE NOTCH	SAYS
MacroPrimer	three tiles, scattered	dispersed knowledge
MacroAccount	four tiles, one block	accounts resolving into one position
MacroKB	one tile, cut in strata	one body of knowledge in layers
MacroBrief	a globe, rising behind the M	the world behind; the M selects what reaches you

The globe is the news icon everyone already reads, drawn the way those icons are: a disc with its **equator and one meridian** knocked out, plus the horizon. It is large — the mark's subject, not an ornament — and seated low, so the M's V cuts its lower third and the whole bottom arc is hidden. The world is behind; the M, in front, is the thing that decides what gets through.

ISOTYPE — ON LIGHT

ON DARK

Construction

Geometry is **derived, not drawn**. Every asset in this book is generated from these constants by `brandbook/build.py`.

centre (500, 290) · r 275 · top y = 15 · bottom y = 565, hidden

THE FULL CIRCLE, DASHED, AND THE M IT HIDES BEHIND

```
globe      centre (500, 290) · r 275
graticule  equator rx 275 · ry 104.5 (foreshorten 0.38)
           meridian rx 104.5 · ry 275
           horizon y = 290 · knock-out 18
gap        the M's outline, knocked out at 18, globe side
```

The centre and radius are chosen together: the top clears $y = 0$, and at every x the circle's lower arc lies below the M's inner edge, so nothing of the bottom shows through the notch. Move one and the other must move with it.

The graticule and the gap

The equator, meridian and horizon are **knocked out as transparent lines** (width 18) in **every** variant, not only the single-ink ones. Filled solid, the globe is a plain disc — a coin, a period — and the idea is gone.

The same knock-out runs along the **M's top edge**, one seam wide, on the globe's side. Without it the one-ink variants fuse globe and M into a single blob, and the “behind” reading — which is the mark — is lost.

NO GAP — WRONG

ONE INK, WITH THE GAP

WHITE ON DARK

WHITE ON MID GREY — THE KNOCK-OUTS SHOW THROUGH

Colour

Ink

#16121a
Text ink, pulled slightly toward the signal hue.

Signal

#d946ef
The brand colour. Unclaimed in the family.

Paper

#f6f4f7
Paper.

Paper, inverted

#120f14
The same in the dark.

WHY FUCHSIA

An alerts product needs an accent that says *look here* and still cannot be mistaken for an error: red is the one colour every interface already spends on failure, and it is MacroMkt's besides. Fuchsia has the urgency without the meaning.

It is also unclaimed across the family: MacroBP gold, MacroReply violet, MacroPrimer green, MacroSkill indigo, MacroAccount blue, MacroKB lime, MacroLinker cyan.

WHERE EACH COLOUR GOES

GROUND	M	GLOBE	WORDMARK
Light	Ink	Signal	Macro ink · Brief signal
Dark	Signal	White	Macro white · Brief signal
One ink	Everything in the one ink; the knock-outs do the separating.		

Type

FACE	WHERE	CONVENTION IT FOLLOWS
Open Sans Bold	The wordmark, only	The family's face — the reason the lockup reads as a sibling.
—	Interface and marketing	The product's decision, not the brand's. Record it here when the product exists.

LOCKUP

```
isotype scale(0.72) translate(0, 97.8) · wordmark 440 / -10 ·  
baseline y 512 from x 880 · canvas 3249 × 698.86
```

The canvas width is that 880 offset plus the wordmark's **measured** extent of 2368.89 — not a round number chosen by eye. “Macro” carries the family; the suffix carries the brand.

Clear space, size, and never

CLEAR SPACE

Half the globe's radius on all sides — 137.5 units, about 14% of the mark's width.
Nothing sets inside it.

MINIMUM SIZE

Below about 20 px the graticule closes and the globe becomes a disc. Use `favicon.svg` at 16 px — it is centred on the mark's true bounding box precisely because a 16 px tab cannot spare the height.

NEVER

- Stretch the mark to fill a square. It is wider than tall; letterbox it.
- Fill the graticule. Solid, the globe is a coin.
- Put the globe in front of the M, or lift it clear of it. Behind is the point.
- Add a dot, pin or badge to the globe. The M already does the selecting.
- Redraw the M. It is shared with every Macro brand and is not ours to change.
- Hand-edit the SVGs. Change the constants and re-run `build.py`.
